

You're ALL IN. Keep it up!

About one year ago, HPAI was detected in Oregon in a backyard flock and captive falcon. In the months that followed HPAI was detected in 15 states, devastating the poultry industry in those states.

ALL IN
or ALL GONE

**PROTECT YOUR FARM.
PROTECT YOUR LIVELIHOOD.**

On December 4, 2015, USDA reported that H5 avian influenza was found in genetic material collected from a wild mallard duck tested in Morrow County, Oregon. This is confirmation that what the poultry disease experts have been saying all along is correct... that it is likely that avian influenza will be circulating in wild birds when they migrate south. The risk is real.

During 2015, it became evident that there was an urgent need to improve biosecurity practices. A tremendous amount of work has gone into preparing for and preventing avian influenza over the past year.

New biosecurity habits have been created. Poultry growers are **ALL IN**, and we are better prepared than ever before.

Please keep your guard up. Stay **ALL IN... ALL THE TIME.**

A message from the Tennessee Poultry Association.
